Why we care
Why we care

Tremblay et al 20
Rain has multiple interesting effects

- Blur from wet air
- Puddles
- Color shifts
- Streaks

These are often quite strongly coupled to scene geometry
Rain - multiple extrinsic phenomena, including smoothing, raindrops, loss of saturation, glossy/wet surfaces, etc. etc.
Rain - phenomena

Refraction causes each drop to contain a tiny image

Figure 7. Looking at the world through a raindrop. (a) An image of a drop hanging from a pipette and a magnified version. (b) Near-perspective views computed using the geometric mapping due to refraction. Note that, in the perspective views, straight lines in the scene are mapped to straight lines in the image.

Garg and Nayar 07
Backscatter

- Refraction in drops causes backscatter of headlight light
  - makes driving in rain at night harder
- Neat trick
  - (Tamburo et al 14)
  - Do not illuminate raindrops by
    - having headlights that are highly steerable (multiple micro mirrors)
    - very fast exposure with usual illumination identifies raindrops
      - too fast for driver to resolve
    - now direct light between drops
**Fig. 7.** A: Our headlight has unprecedented resolution over space and time so that beams of light may be sent in between the falling snow. Illustration adapted from [11]. B: Artificial snowflakes brightly illuminated by standard headlight. C: Our system avoids illuminating snowflakes making them much less visible.
Rain - phenomena

Drops move fast, and so create motion blur (streaks)

Figure 9. (I) Raindrops and motion-blur. An image of a scene taken in rain with (a) a short exposure time of 1 ms and (b) with typical exposure time of a camera (30 ms). (II) The intensities produced by motion-blurred raindrops. II (a) The average irradiance at the pixel due to the raindrop is $E_r$ and that due to the background scene is $E_b$. Note that $E_r > E_b$. The drop projects onto a pixel for time $\tau < 1.18$ ms, which is far less than the typical exposure time $T$ of a camera. (b) Intensities of a pixel in three frames. A drop stays over the pixel in only a single frame and produces a positive intensity fluctuation of unit frame width.

Garg and Nayar 07
Rain - phenomena

Shallow free space - individual rain streaks
Deep free space - more bulk, fog-like effects

Figure 13. Dynamic weather and visibility: (I) (a) Frame from a video of a scene where rain is visible. The intensity variation due to rain is high. (b) Frame from a video of the same scene taken with camera parameters to reduce the visibility due to rain. The intensity at the same pixel shows low variance over time. (II) The change in intensity produced by a falling raindrop as a function of the drop’s distance \( z \) from the camera. The change in intensity \( \Delta I \) does not depend on \( z \) for drops that are close to the camera (\( z < z_m \)). While for raindrops far from the camera (\( z > z_m \)), \( \Delta I \) decreases as \( 1/z \) and for distances greater than \( Rz_m \), \( \Delta I \) is too small to be detected by the camera. Therefore, the visual effects of rain are only due to raindrops that lie close to the camera (\( z < Rz_m \)) which we refer to as the rain visible region.

Garg and Nayar 07
Rain - phenomena

Shallow free space - individual rain streaks
Deep free space - more bulk, fog-like effects

Figure 1: (a) An example real photo that demonstrates the scene visibility variation with depth, and the presence of rain streaks and fog; and (b) a plot of rain streak intensity ($t_r$) against scene depth ($d$) based on the model in [13].

Hu et al 19
Strategies

• Train on rainy data
  • tough to get more labels in sufficient quantity
  • BUT
    • you could drive the same road many times, as above
    • and fix labels

• Simulate rain and fine-tune methods
  • labels remain the same

• Derain images
Simulating rain

Fig. 1 Vision tasks in clear and rain-augmented images. Our synthetic rain rendering framework allows for the evaluation of computer vision algorithms in challenging bad weather scenarios. We render physically-based, realistic rain on images from the KITTI [23] (rows 1-2) and Cityscapes [13] (rows 3-4) datasets with object detection from mx-RCNN [73] (row 2), semantic segmentation from ESPNet [65] (row 4). We also present a combined data-driven and physic-based rain rendering approach which we apply to the nuScenes [9] (rows 5-6) dataset with depth estimation from Monodepth2 [25] (row 6). All algorithms are quite significantly affected by rainy conditions.
Simulating rain - issues

• Near field:
  • drops are bright, discrete, likely ballistic motion
    • how bright?
    • where?
    • how moving?
  • likely air is “wet”
    • so some fogging, depending on depth

• Far field:
  • fog like effects

• So we need to know
  • depth, environment map, falling drops, camera movement
Simulating rain

Fig. 2 Physics-Based Rendering for rain augmentation. We use particles simulation together with depth and illumination estimation to render arbitrarily controlled rainfall on clear images.
Simulating rain

Minor errors in environment map have no real effect on rain appearance

Tremblay et al 20
Simulating rain

- Trick:
  - rain causes color effects, specular effects etc.
    - CycleGAN is good at this, but bad at streaks
    - Physics based simulation is bad at this but good at streaks

Fig. 5 GAN+PBR rain-augmentation architecture. In this hybrid approach, clear images are first translated into rain with CycleGAN [83] and subsequently augmented with rain streaks with our PBR pipeline (see fig. 2).

* Not evaluated due to lack of semantic labels for GAN training.

**Table 2 Improving performance of computer vision tasks on real nuScenes [9] images.** These tasks are object detection (YOLOv2 [59]), semantic segmentation (PSPNet [82]), and depth estimation (Monodepth2 [25]). The last line shows performance with the untuned models after the de-raining [50] process.
Deraining - strategies

- Essentially
  - obtain images with/without rain (with rain by synthetic)
  - train network to reproduce without rain image from with rain
  - starts with Eigen et al 13

From Eigen et al. 13
Rainy windows

From Eigen et al. 13
Rain streaks

Figure 7: Visual comparison of different rain streak removal methods on real example images.

Li et al 16
Figure 6: Real rain streaks removal experiments under different scenarios. From left to right are input image, results of DSC[26], LP [24], CNN [10], DID-MDN[31] and ours. Demarcated areas in each image are amplified at a 3 time larger scale.
Both rain streaks and haze

Figure 7. Examples of JORDER-R-DEVEIL on heavy rain (left two images) and mist images (right two images).
